## German 'hacker' uses rented computing to crack hashing algorithm Brute force PAYG hack attack cracks SHA1 hashes – for \$2

A German security enthusiast has used rented computing resources to crack a secure hashing algorithm (SHA-1) password.

Thomas Roth used a GPU-based rentable computer resource to run a brute force attack to crack SHA1 hashes. Encryption experts warned for at least five years SHA-1 could no longer be considered secure so what's noteworthy about Roth's project is not what he did or the approach he used, which was essentially based on trying every possible combination until he found a hit, but the technology he used.

SHA-1, although it is in the process of being phased out, still forms a component of various widely-used security applications, including Secure Sockets Layer, Transport Layer Security and S/MIME protocols. Roth claims to have cracked all the hashes from a 160-bit SHA-1 hash with a password of between one and six characters in around 49 minutes.

- ❑ Cryptanalysis Tools

# Module Flow

# Cryptography

Cryptography is the **conversion of data** into a scrambled code that is decrypted and sent across a private or public network

Cryptography is used to **protect** e-mail messages, credit card information, and corporate data

## Objectives of Cryptography

1. Confidentiality
2. Integrity
3. Authentication
4. Non-Repudiation

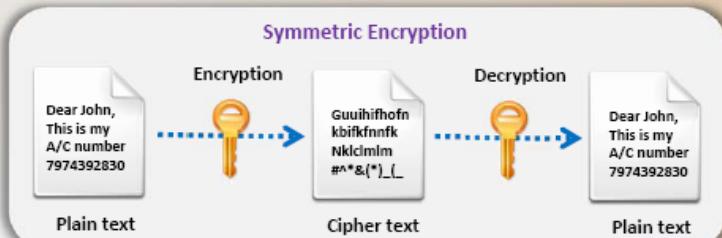

# Types of Cryptography

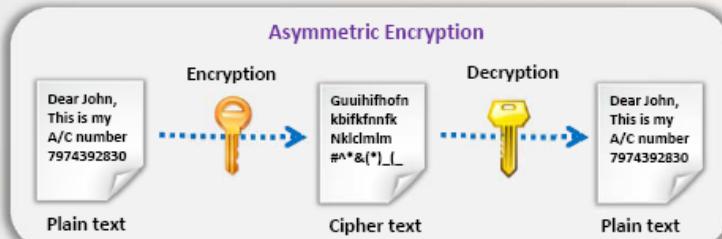

## Symmetric Encryption

Symmetric encryption (secret-key, shared-key, and private-key) uses the same key for encryption as they do for decryption

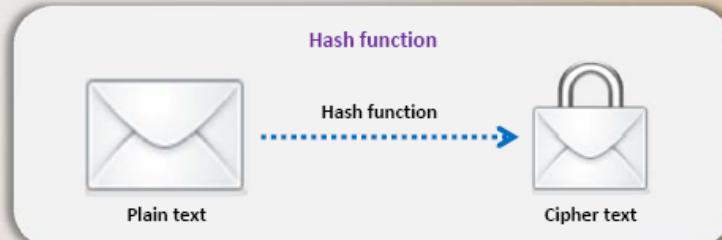

## Asymmetric Encryption

Asymmetric encryption (public-key) uses different encryption keys for encryption and decryption. These keys are known as public and private keys

## Hash Function

Hash function (message digests or one - way encryption) uses no key for encryption and decryption

# Government Access to Keys (GAK)

Government Access to Keys means that software companies will give copies of all keys, (or at least enough of the key that the remainder could be cracked) to the government

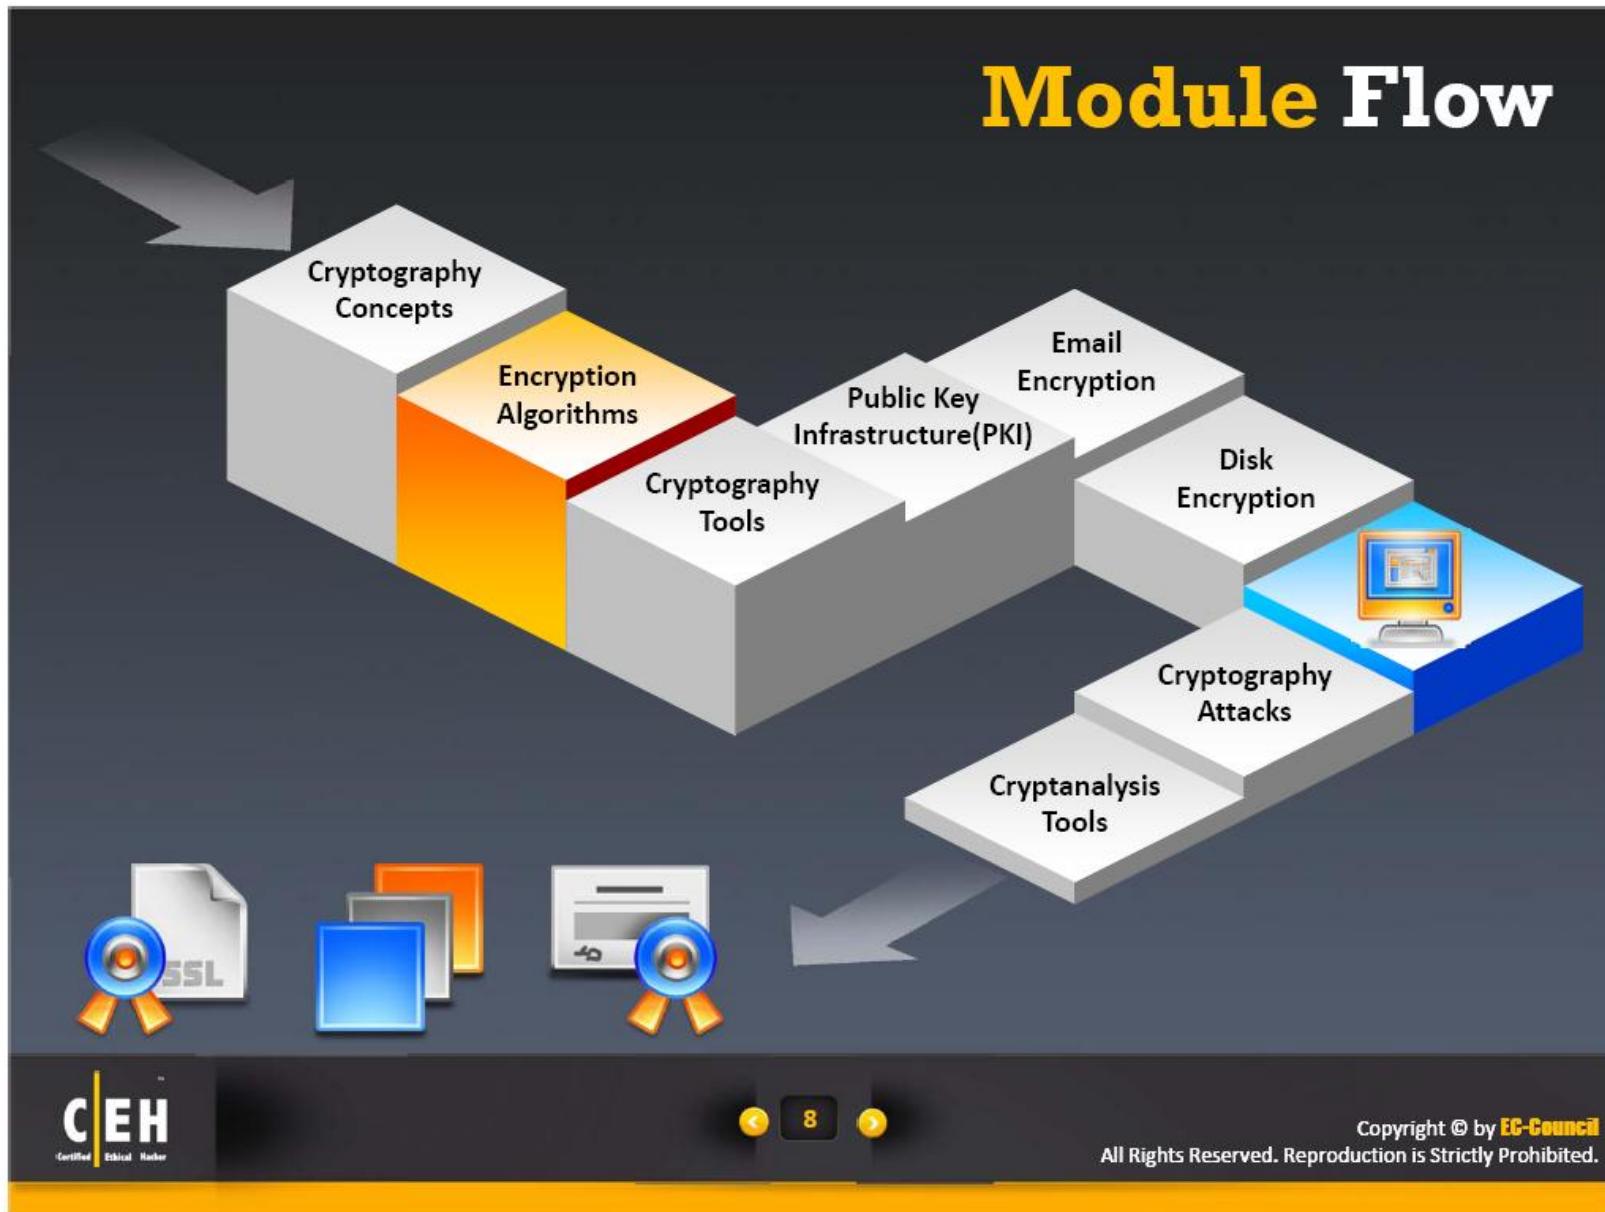

The government promises that they will hold on to the keys in a secure way, and will only use them when a court issues a warrant to do so

To the government, this issue is similar to the ability to wiretap phones

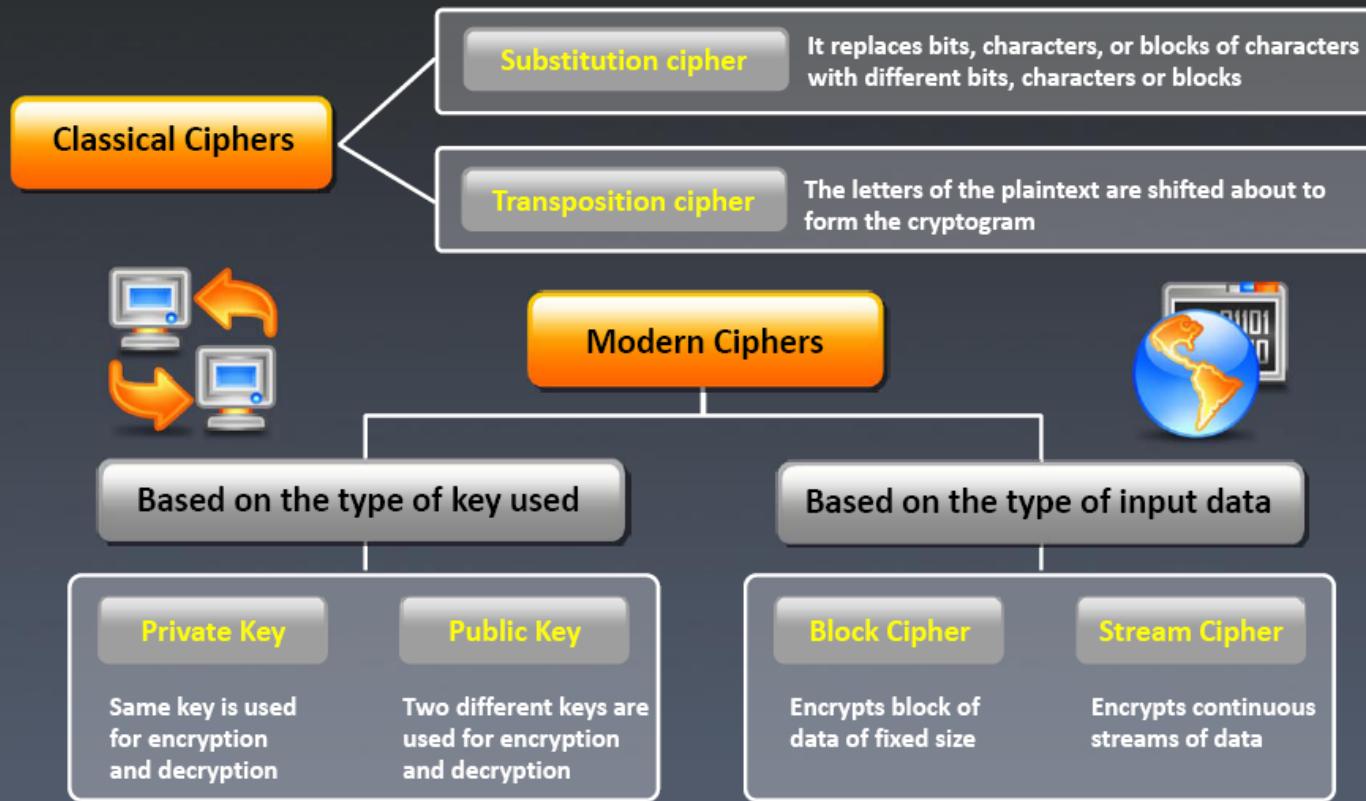

Certified Ethical Hacker

# Module Flow

# Ciphers

Ciphers are algorithms used to encrypt or decrypt the data

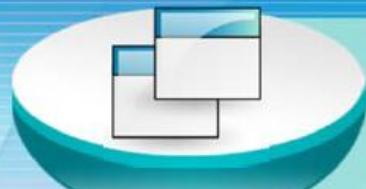

# Advanced Encryption Standard (AES)

The diagram features four colored sections (pink, orange, yellow, green) on a grey base. A set of silver keys is shown above the pink section. The pink section contains a file icon and text about AES being a symmetric-key standard. The orange section contains a padlock icon and text about AES being an iterated block cipher. The yellow section contains a padlock icon and text about its 128-bit block size and key sizes. The green section contains the title 'AES Pseudocode' and a block of pseudocode.

**AES Pseudocode**

```
Cipher (byte in[4*Nb], byte out[4*Nb], word w[Nb*(Nr+1)])
begin
    byte state[4,Nb]
    state = in
    AddRoundKey(state, w)
    for round = 1 step 1 to Nr-1
        SubBytes(state)
        ShiftRows(state)
        MixColumns(state)
        AddRoundKey(state,
                    w+round*Nb)
    end for
    SubBytes(state)
    ShiftRows(state)
    AddRoundKey(state, w+Nr*Nb)
    out = state
end
```

# Data Encryption Standard (DES)

● DES, is the name of the **Federal information Processing Standard (FIPS) 46-3**, which describes the data encryption algorithm (DEA)

● The DEA is a symmetric cryptosystem originally **designed for implementation in hardware**

● DEA is also **used for single-user encryption**, such as to store files on a hard disk in encrypted form

# RC4, RC5, RC6 Algorithms

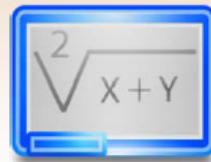

**RC4**

A variable key size stream cipher with byte-oriented operations, and is based on the use of a random permutation

**RC5**

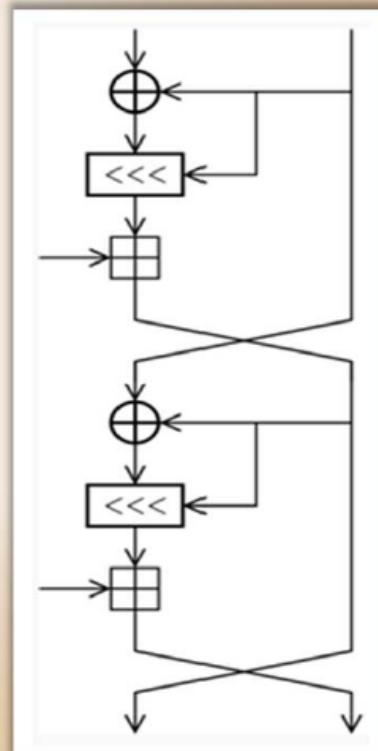

It is a parameterized algorithm with a variable block size, a variable key size, and a variable number of rounds. The key size is 128-bits

**RC6**

RC6 adds two features to RC5: the inclusion of integer multiplication, and the use of four 4-bit working registers instead of RC5's two 2-bit registers

**RC5**

# The DSA and Related Signature Schemes

## Digital Signature Algorithm

The DSA has become a U.S. Federal Information Processing Standard (FIPS 186) called the Digital Signature Standard (DSS)

## Digital Signature

It is the first digital signature scheme recognized by any government

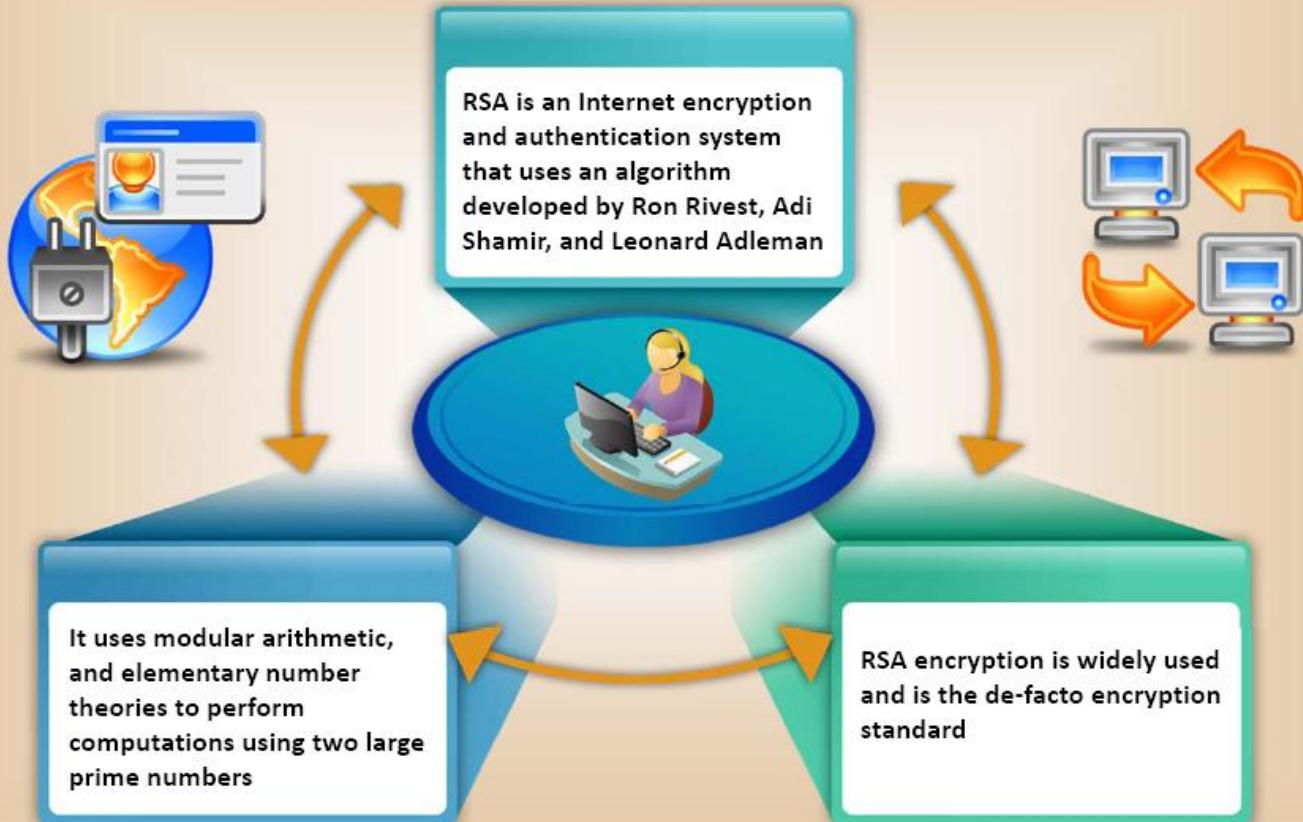

Each entity creates a public key and corresponding private key

1. Select a prime number  $q$  such that  $2^{159} < q < 2^{160}$
2. Choose  $t$  so that  $0 \leq t \leq 8$
3. Select a prime number  $p$  such that  $2^{511+64t} < p < 2^{512+64t}$  with the additional property that  $q$  divides  $(p-1)$
4. Select a generator  $\alpha$  of the unique cyclic group of order  $q$  in  $Z_{p}^{*}$
5. To compute  $\alpha$ , select an element  $g$  in  $Z_{p}^{*}$  and compute  $g^{(p-1)/q} \bmod p$
6. If  $\alpha = 1$ , perform step five again with a different  $g$
7. Select a random  $a$  such that  $1 \leq a \leq q-1$
8. Compute  $y = \alpha^a \bmod p$

The public key is  $(p, q, \alpha, y)$ . The private key is  $a$ .

# RSA (Rivest Shamir Adleman)

# Example of RSA Algorithm

```
P = 61    <= first prime number (destroy this after computing E and D)
Q = 53    <= second prime number (destroy this after computing E and D)
PQ = 3233 <= modulus (give this to others)
E = 17    <= public exponent (give this to others)
D = 2753  <= private exponent (keep this secret!)

Your public key is (E,PQ).
Your private key is D.

The encryption function is: encrypt(T) = (T^E) mod PQ
                                = (T^17) mod 3233

The decryption function is: decrypt(C) = (C^D) mod PQ
                                = (C^2753) mod 3233

To encrypt the plaintext value 123, do this:

encrypt(123) = (123^17) mod 3233
                = 337587917446653715596592958817679803 mod 3233
                = 855

To decrypt the cipher text value 855, do this:

decrypt(855) = (855*2753) mod 3233
                = 123
```

# The RSA Signature Scheme

## Algorithm Key generation for the RSA signature scheme

SUMMARY: each entity creates an RSA public key and a corresponding private key.  
Each entity A should do the following:

1. Generate two large distinct random primes  $p$  and  $q$ , each roughly the same size.
2. Compute  $n = pq$  and  $\phi = (p - 1)(q - 1)$ .
3. Select a random integer  $e$ ,  $1 < e < \phi$ , such that  $\gcd(e, \phi) = 1$ .
4. Use the extended Euclidean algorithm (Algorithm 2.107) to compute the unique integer  $d$ ,  $1 < d < \phi$ , such that  $ed \equiv 1 \pmod{\phi}$ .
5. A's public key is  $(n, e)$ ; A's private key is  $d$ .

## Algorithm RSA signature generation and verification

SUMMARY: entity A signs a message  $m \in \mathcal{M}$ . Any entity B can verify A's signature and recover the message  $m$  from the signature.

1. *Signature generation.* Entity A should do the following:
  - (a) Compute  $\tilde{m} = R(m)$ , an integer in the range  $[0, n - 1]$ .
  - (b) Compute  $s = \tilde{m}^d \pmod{n}$ .
  - (c) A's signature for  $m$  is  $s$ .
2. *Verification.* To verify A's signature  $s$  and recover the message  $m$ , B should:
  - (a) Obtain A's authentic public key  $(n, e)$ .
  - (b) Compute  $\tilde{m} = s^e \pmod{n}$ .
  - (c) Verify that  $\tilde{m} \in \mathcal{M}_R$ ; if not, reject the signature.
  - (d) Recover  $m = R^{-1}(\tilde{m})$ .

# Message Digest (One-way Bash) Functions

Message digest functions calculate a unique fixed-size bit string representation called Hash Value of any arbitrary block of information

If any given bit of the function's input is changed, every output bit has a 50 percent chance of changing

It is computationally infeasible to have two files with the same message digest value

# Message Digest Function: MD5

MD5 Algorithm

MD5 algorithm takes a message of arbitrary length as input and outputs a 128-bit fingerprint or message digest of the input

*MD5 hash is a 32-digit hexadecimal number*

MD5 is not collision resistant, use of latest algorithms such as SHA-1 and SHA-2 is recommended

It is widely used for digital signature applications, file integrity checking and storing passwords

# Secure Hashing Algorithm (SHA)

N  
I  
S  
T

It is an algorithm for generating cryptographically secure one-way hash, published by the National Institute of Standards and Technology as a U.S. Federal Information Processing Standard

## SHA1

It produces a 160-bit digest from a message with a maximum length of  $(2^{64} - 1)$  bits, resembles the MD5 algorithm

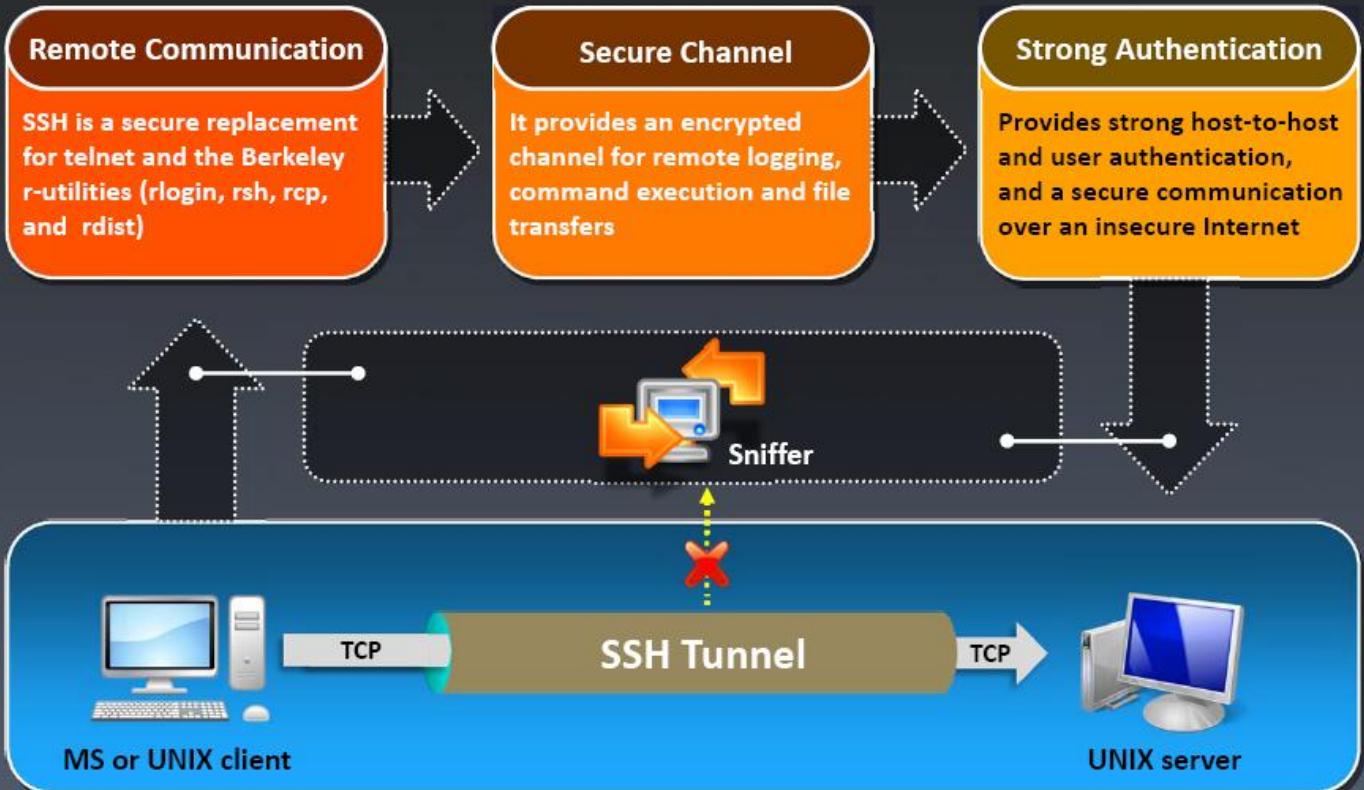

## SHA2

It is a family of two similar hash functions, with different block sizes, namely SHA-256 that uses 32-bit words and SHA-512 that uses 64-bit words

## SHA3

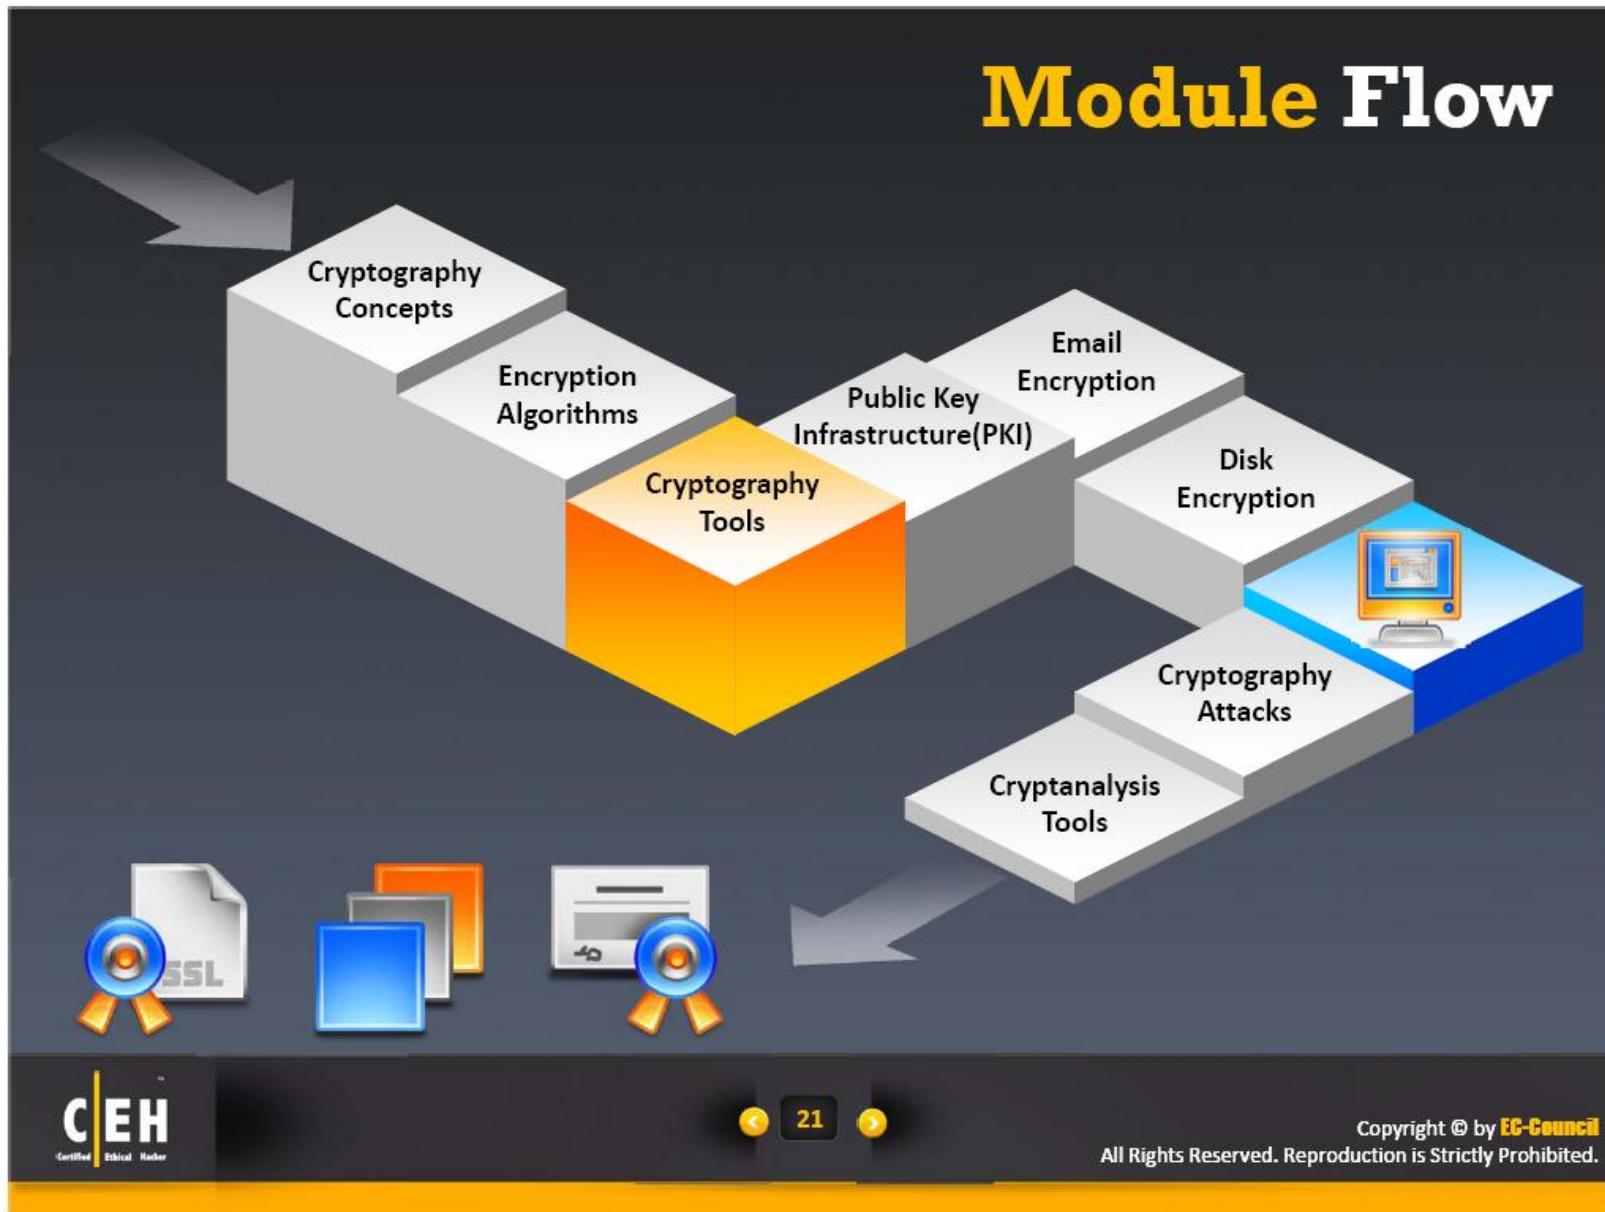

It is a future hash function standard still in development, chosen in a public review process from non-government designers

# What is SSH (Secure Shell)?

Note: SSH2 is a more secure, efficient, and portable version of SSH that includes SFTP, an SSH2 tunneled FTP

# MD5 Hash Calculators: HashCalc, MD5 Calculator and HashMyFiles

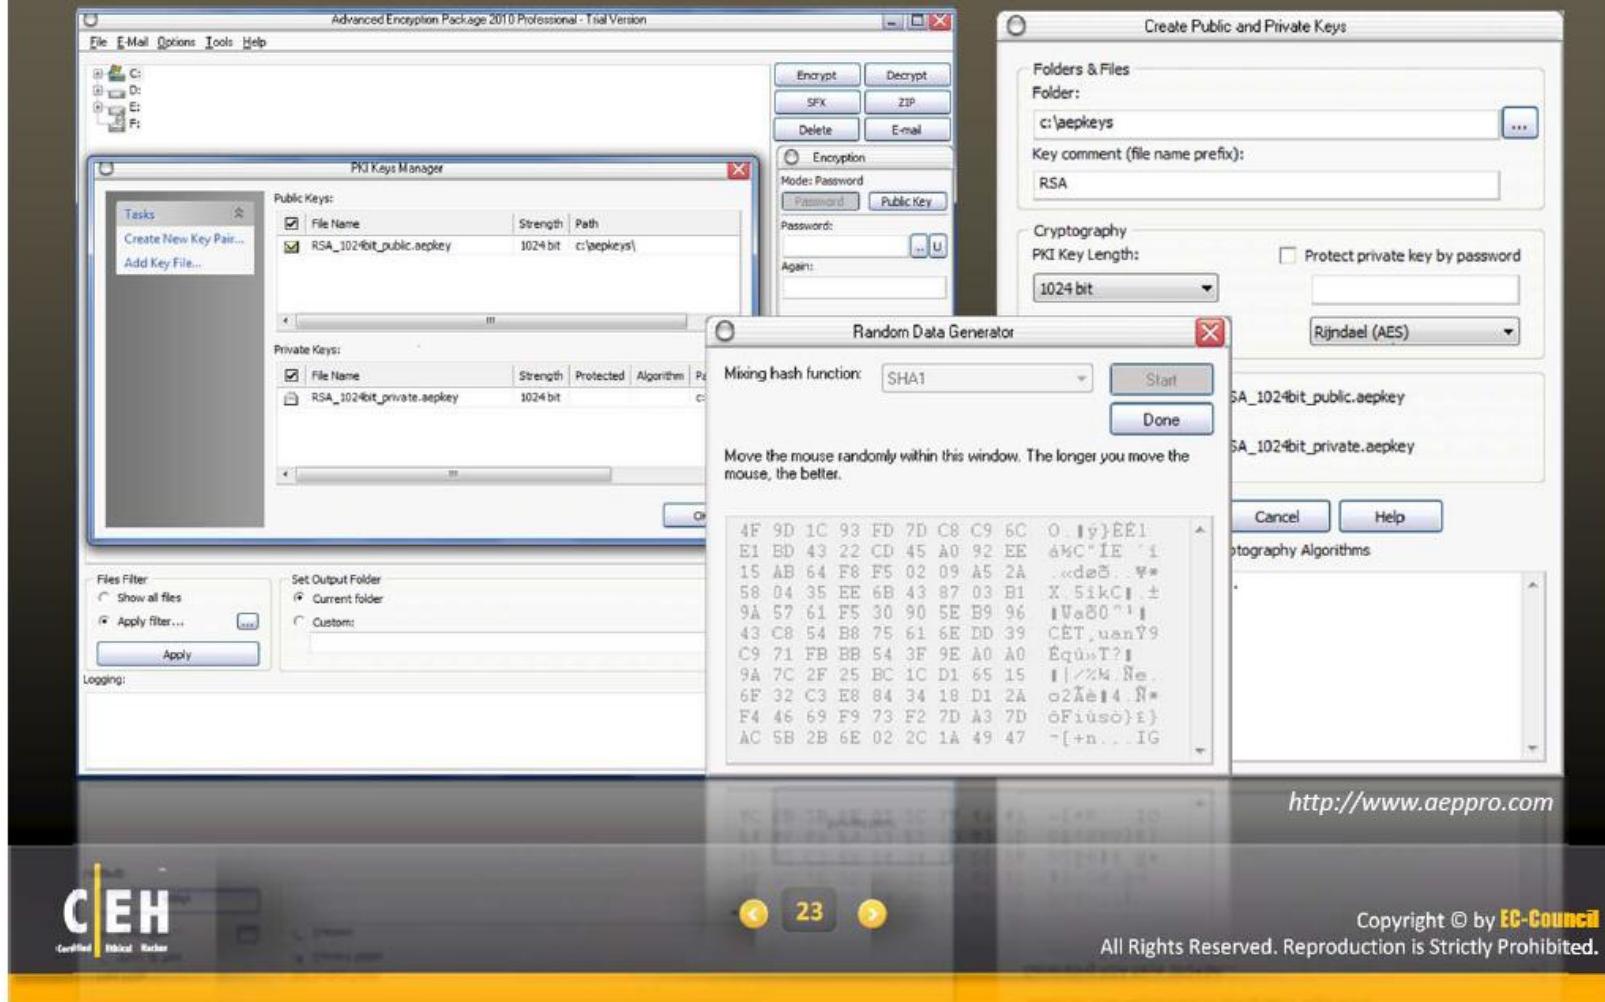

The image shows three windows side-by-side:

- HashCalc**: A Windows application window titled "HashCalc". It has a "Data Format" dropdown set to "Text string" containing the text "Meeting at 2PM". Below it is a "Key Format" dropdown set to "Text string". A list of hashing algorithms is shown with checkboxes:
  - MD5 (checked): Value: c4521340fb04258e24d272d31862faa
  - MD4
  - SHA1 (checked): Value: ba70b3e75923efaf67dd9a44e6e4ad8924577090f
  - SHA256
  - SHA384 (checked): Value: 8415703ff2ce81179b47a20b18234eac49e4a73af5bf8de
  - SHA512
  - RIPemd160
  - PANAMA
  - TIGER (checked): Value: d21874ee87da05946fcccc8562b72227f0a4926abd952af
  - MD2
  - ADLER32
  - CRC32 (checked): Value: 9c1f2cb2
  - eDonkey/ eMule
- MD5 Calculator**: A Windows application window titled "MD5 Calculator". It has a "File Name" input field containing "C:\Users\...\\Desktop\\Cryptography.txt" and a "Calculate" button. Below it is a "MD5 Digest" input field showing "0da02e4e2cd8bd0ab1fa8295af1a4fb" and a "Compare To" input field. There is also an "Upper case" checkbox and an "Exit" button.
- HashMyFiles**: A Windows application window titled "HashMyFiles". It displays a file list with columns: "Filename", "MD5", "SHA1", "CRC32", and "Full Path". The files listed are:

Filename	MD5	SHA1	CRC32	Full Path
Crypt.txt	904ee50296118603692917df...	14bcd5de180e1be715f7c8...	bf21c4e7	C:\Users\...

# Module Flow

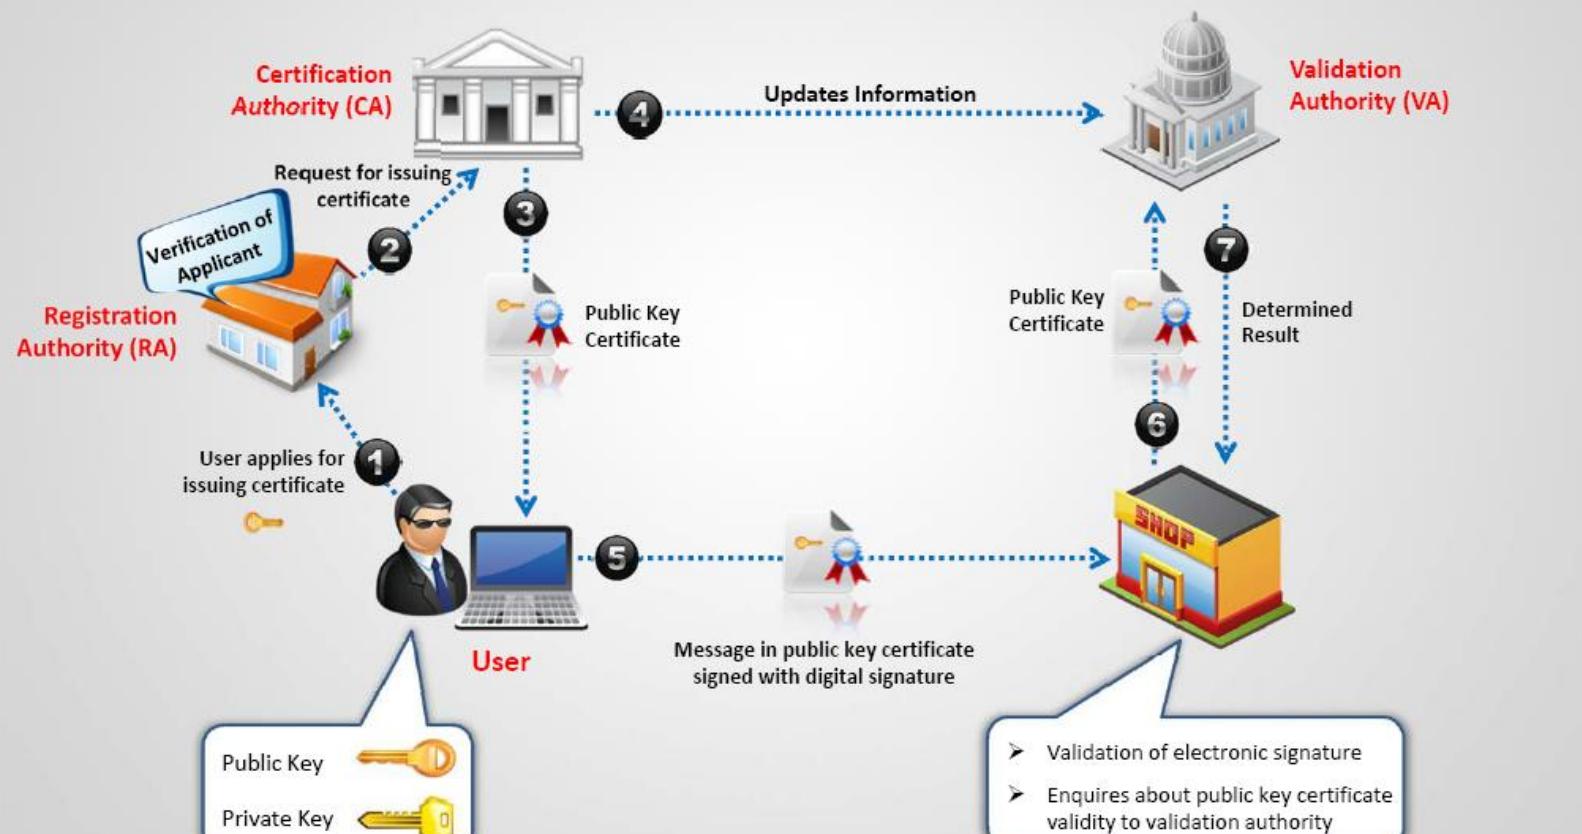

# Public Key Infrastructure (PKI)

Public Key Infrastructure (PKI) is a **set of hardware, software, people, policies, and procedures** required to create, manage, distribute, use, store, and revoke **digital certificates**

# Public Key Infrastructure (PKI)

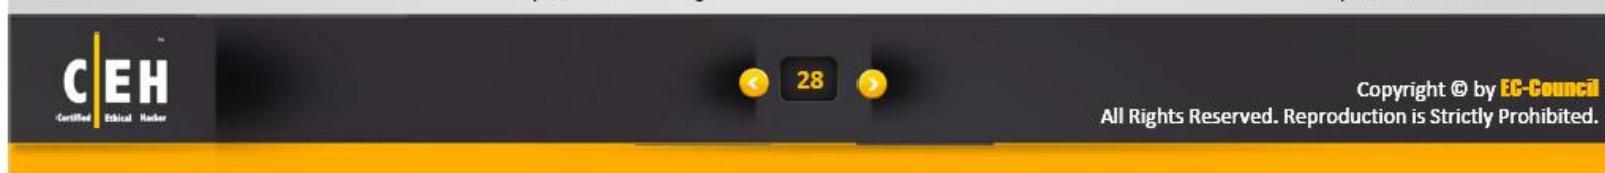

# Certification Authorities

The Comodo website features a banner for "The First To Bring You a Full Line of 2048 bit Certificates". It includes sections for "Explore Our SSL Certificates" and "E-COMMERCE SOLUTIONS". The URL is <http://www.comodo.com>.

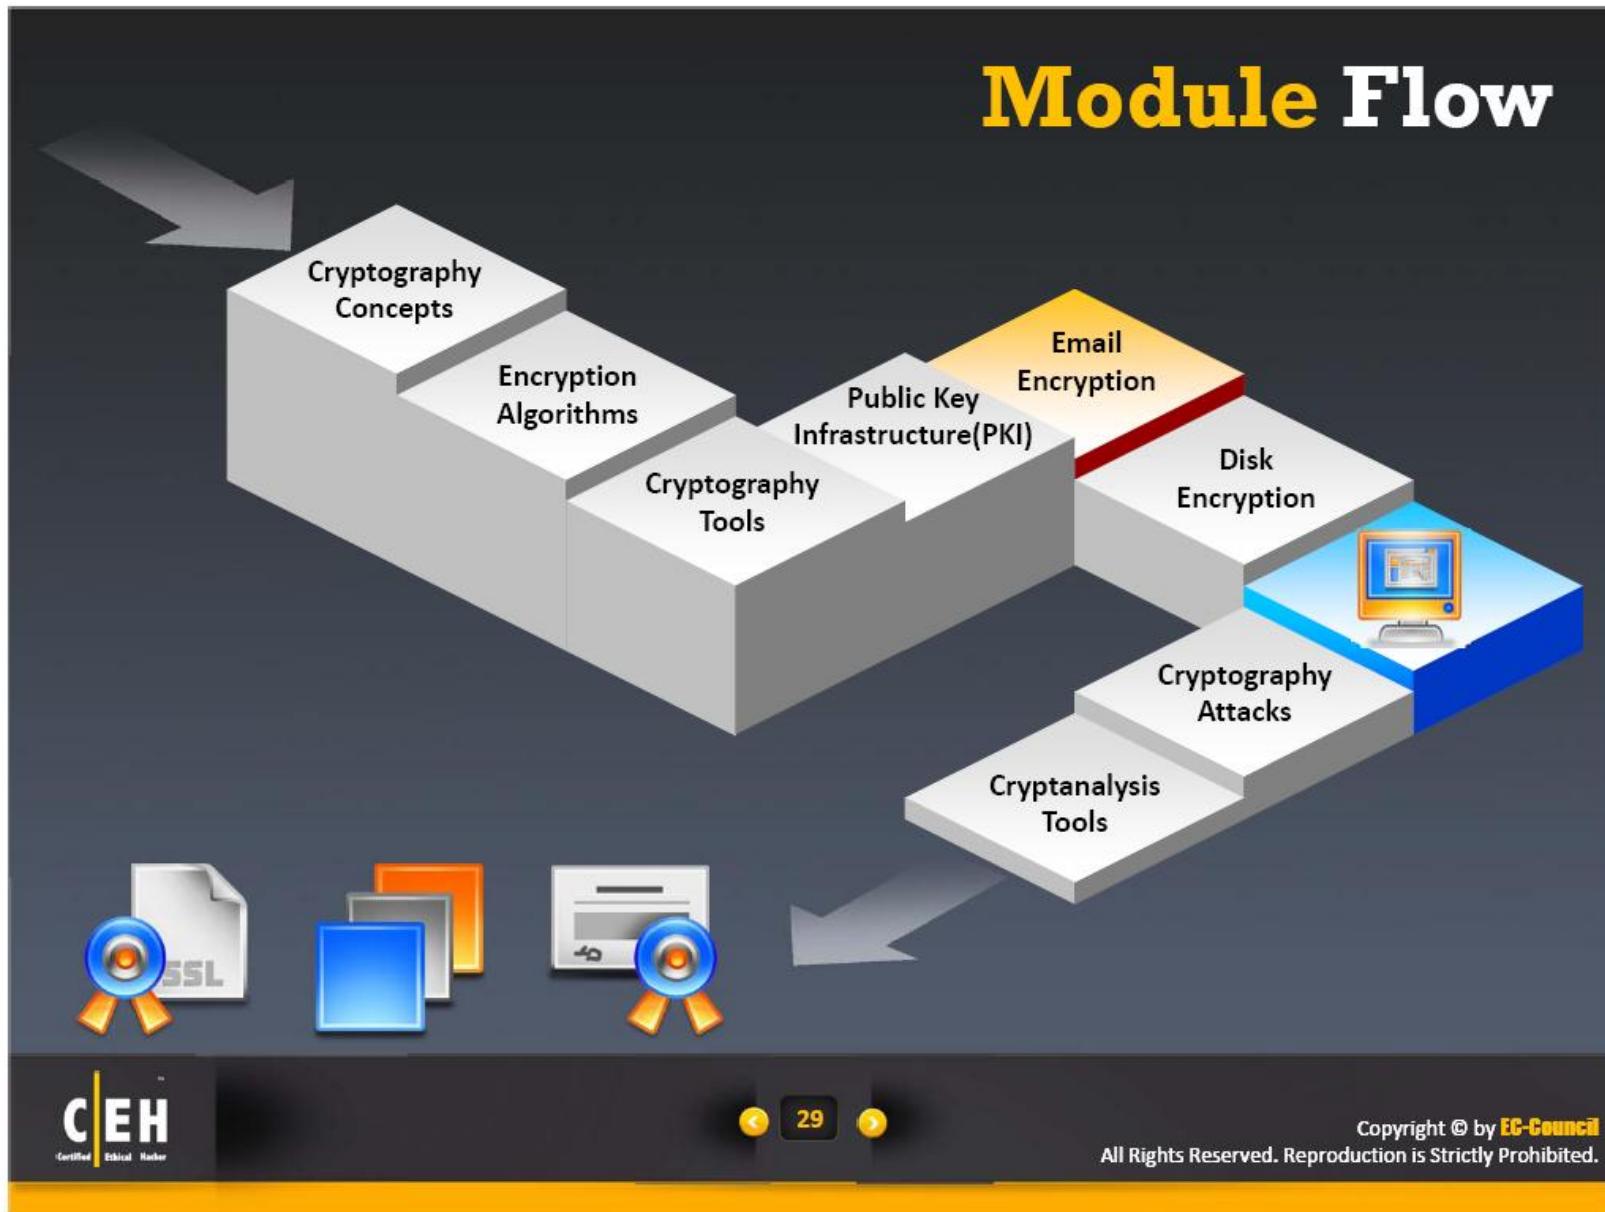

The Thawte website highlights "online security trusted by millions around the world". It features sections for "Get started with SSL", "Inspire Trust Online", and "Beyond E-Commerce". The URL is <http://www.thawte.com>.

The VeriSign website offers "Protect Yourself Online" services like SSL Certificates, VeriSign Trust Seal, and Code Signing. It also integrates with Symantec. The URL is <http://www.verisign.com>.

The Entrust website promotes "All digital certificates. All in one place." It lists various certificate types including SSL, Signing, User, and Certificate Management Services. The URL is <http://www.entrust.net>.

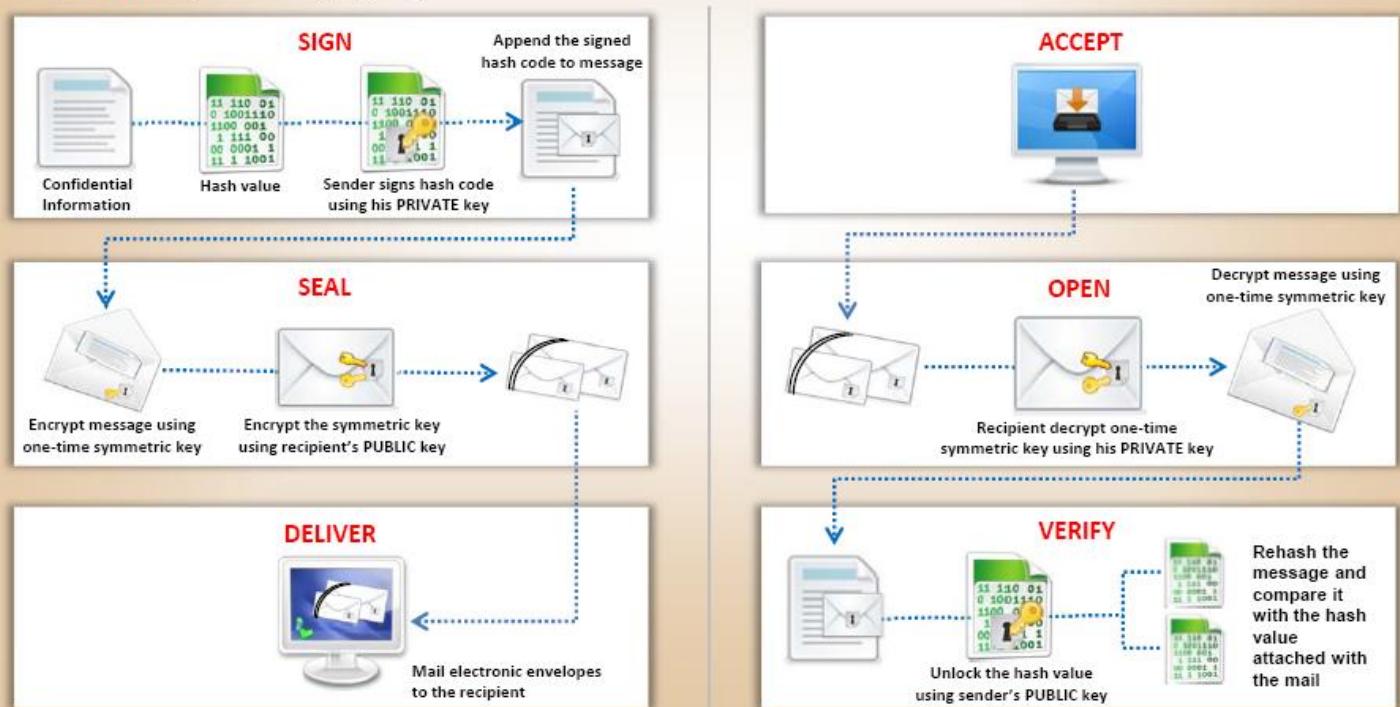

# Module Flow

# Digital Signature

- Digital signature used asymmetric cryptography to simulate the security properties of a **signature in digital, rather than written form**
- Digital signature schemes involve two algorithms; a **private key** for signing the message and a **public key** for verifying signatures

# SSL (Secure Sockets Layer)

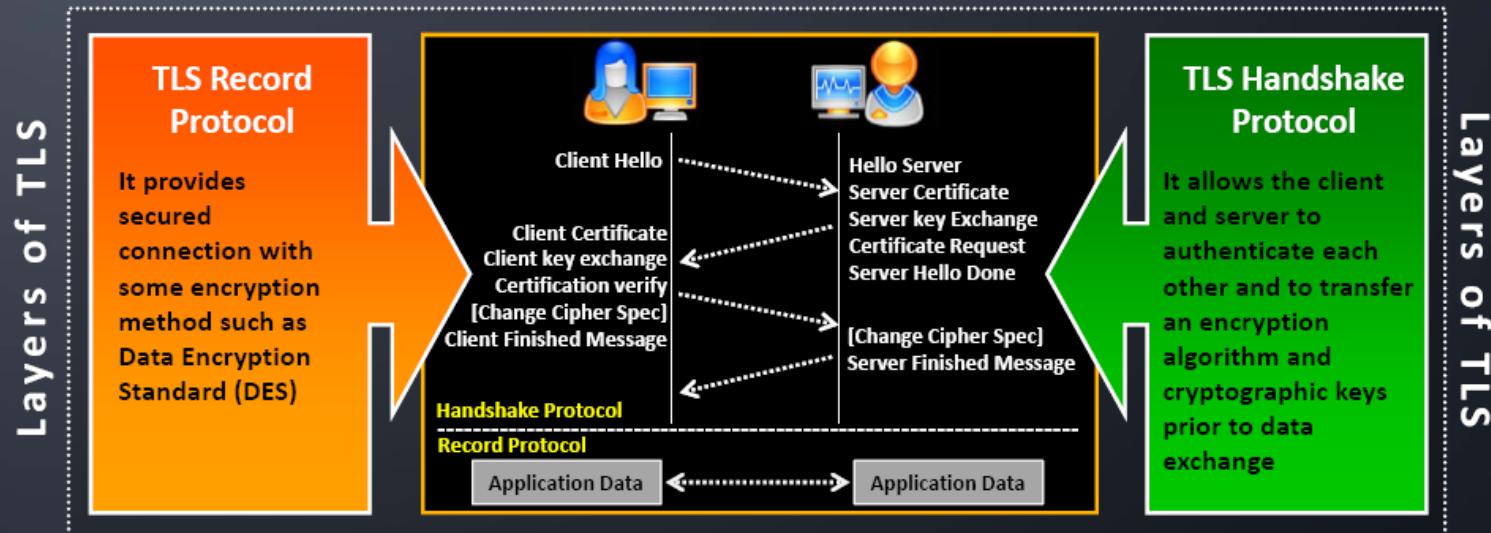

- SSL is an application layer protocol developed by Netscape for **managing the security** of a message transmission on the Internet
- It uses **RSA asymmetric (public key) encryption** to encrypt data transferred over a SSL connection

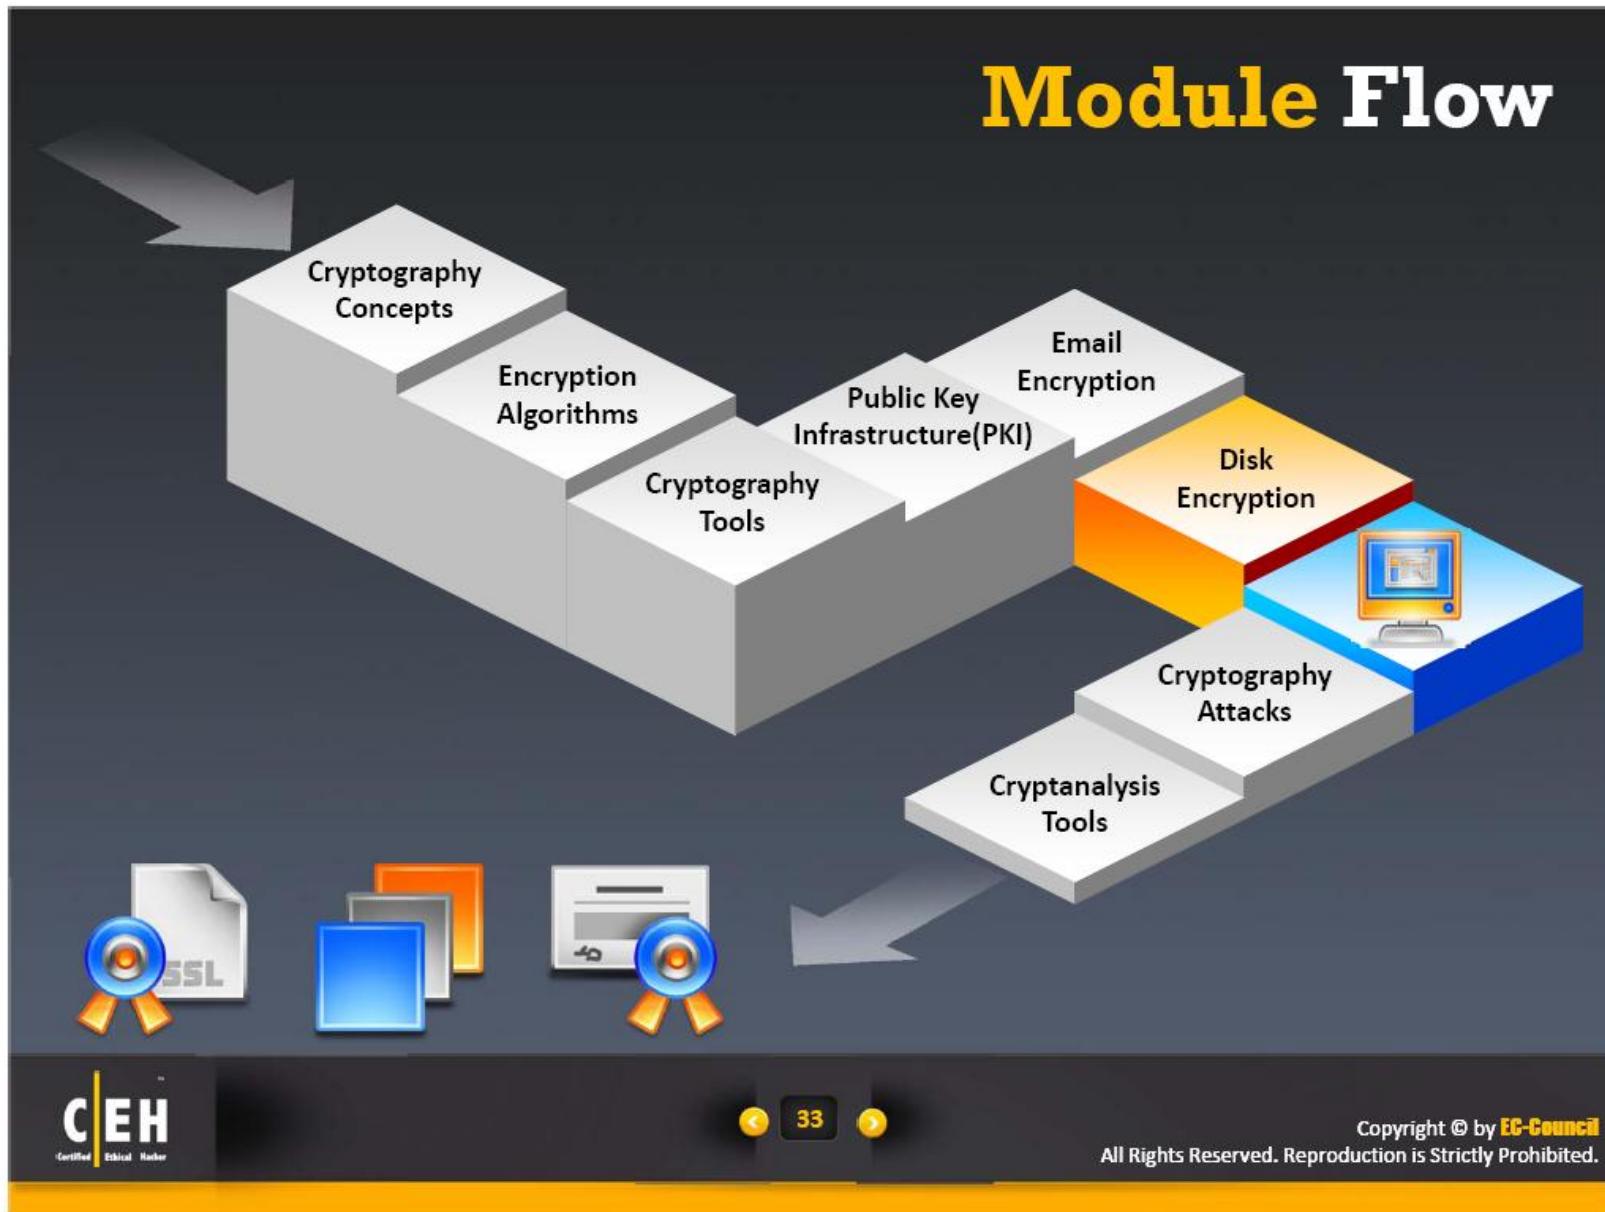

# Transport Layer Security (TLS)

TLS is a protocol to establish a secure connection between a client and a server and ensure privacy and integrity of information during transmission

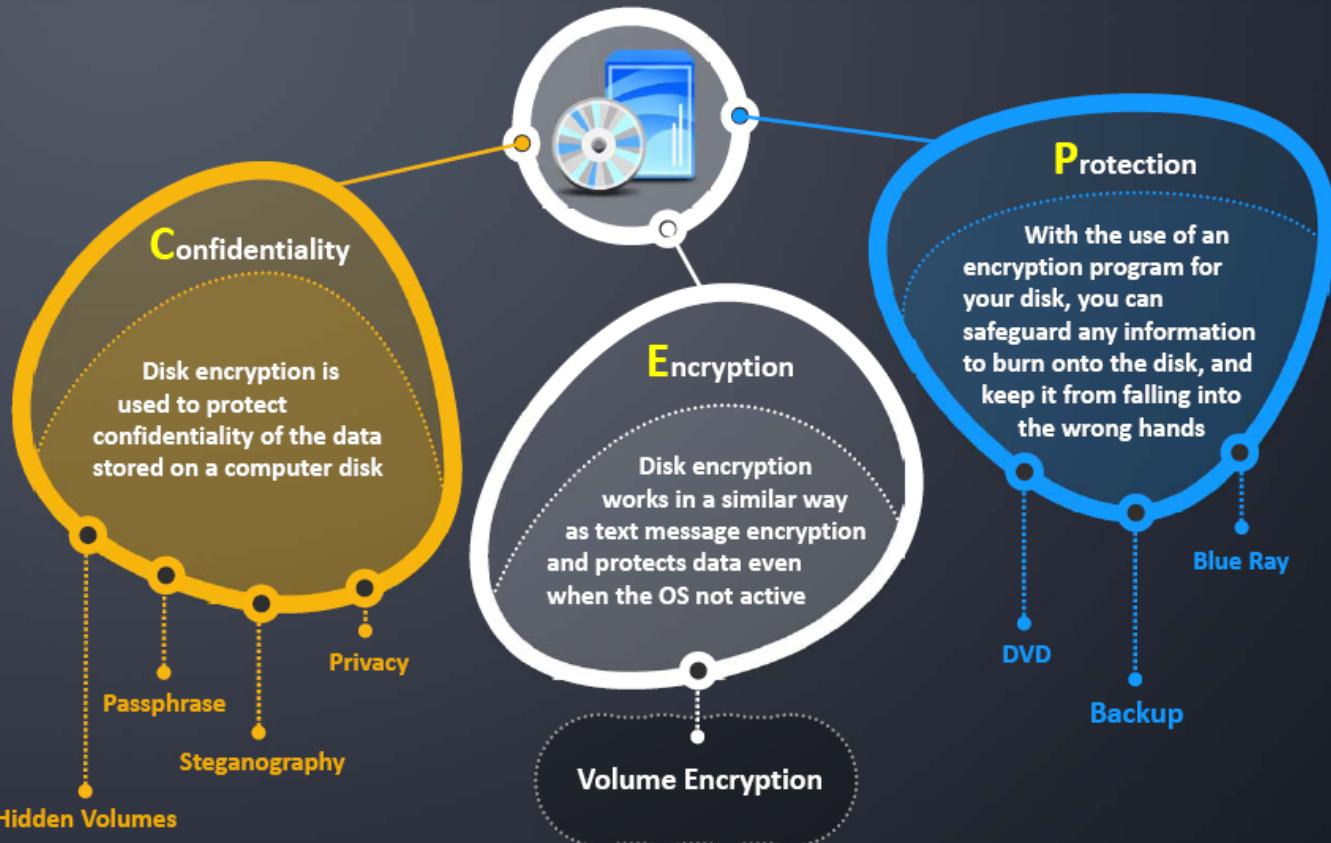

It uses RSA algorithm with 1024 and 2048 bit strengths

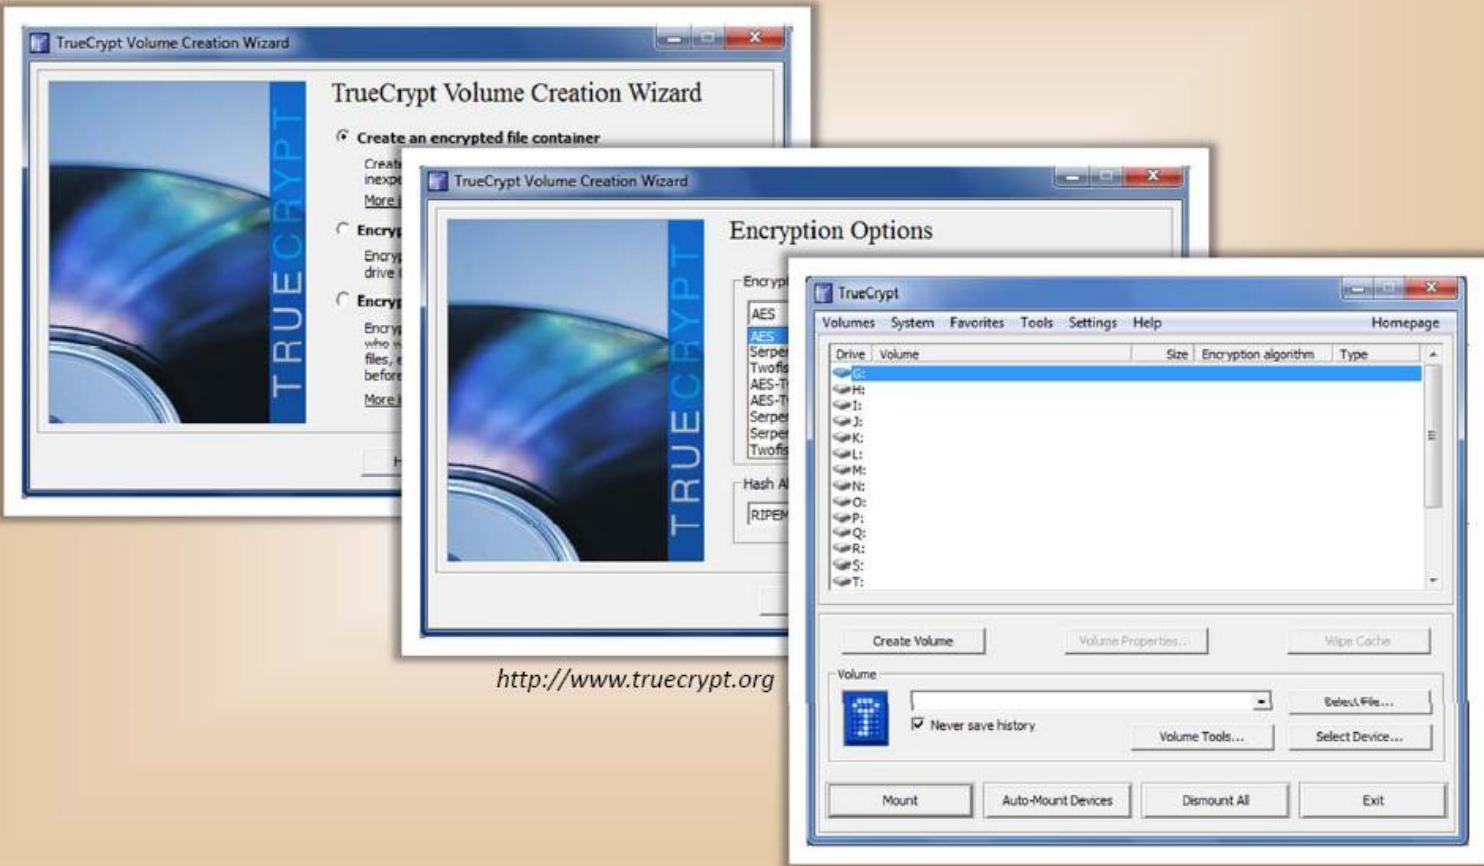

# Module Flow

# Cryptography Attacks

Cryptography attacks are based on the assumption that the cryptanalyst has knowledge of the encrypted information

# Cryptography Attacks

## Ciphertext-only Attack

The attacker's goal is to discover the plaintext of the messages by figuring out the key used in the encryption process

## Adaptive Chosen-plaintext Attack

Attacker uses this technique when he has free use of a piece of decryption hardware, but is unable to extract the decryption key from it

## Chosen-ciphertext Attack

Attacker can choose the ciphertext to be decrypted and has access to the resulting decrypted plaintext

## Rubber Hose Attack

Extraction of cryptographic secrets (e.g. the password to an encrypted file) from a person by coercion or torture

# Cryptography Attacks

## Chosen-plaintext

- Attacker defines his own plaintext, feeds it into the cipher, and analyzes the resulting ciphertext

## Known-plaintext Attack

- The attacker's goal is to discover the key used to encrypt the messages so that other messages can be deciphered and read

## Chosen-key Attack

- A generalization of the chosen-text attack

## Timing Attack

- It is based on repeatedly measuring the exact execution times of modular exponentiation operations

# Code Breaking Methodologies

## Trickery and Deceit

It involves the use of social engineering techniques to extract cryptography keys

## Brute-Force

Cryptography keys are discovered by trying every possible combination

## One-Time Pad

A one-time pad contains many non-repeating groups of letters or number keys, which are chosen randomly

## Frequency Analysis

It is the study of the frequency of letters or groups of letters in a ciphertext

It works on the fact that, in any given stretch of written language, certain letters and combinations of letters occur with varying frequencies

# Brute-Force Attack

Defeating a cryptographic scheme by trying a large number of possible keys until the correct encryption key is discovered

Brute-Force attack is a high resource and time intensive process, however, more certain to achieve results

Success of brute force attack depends on length of the key, time constraint, and system security mechanisms

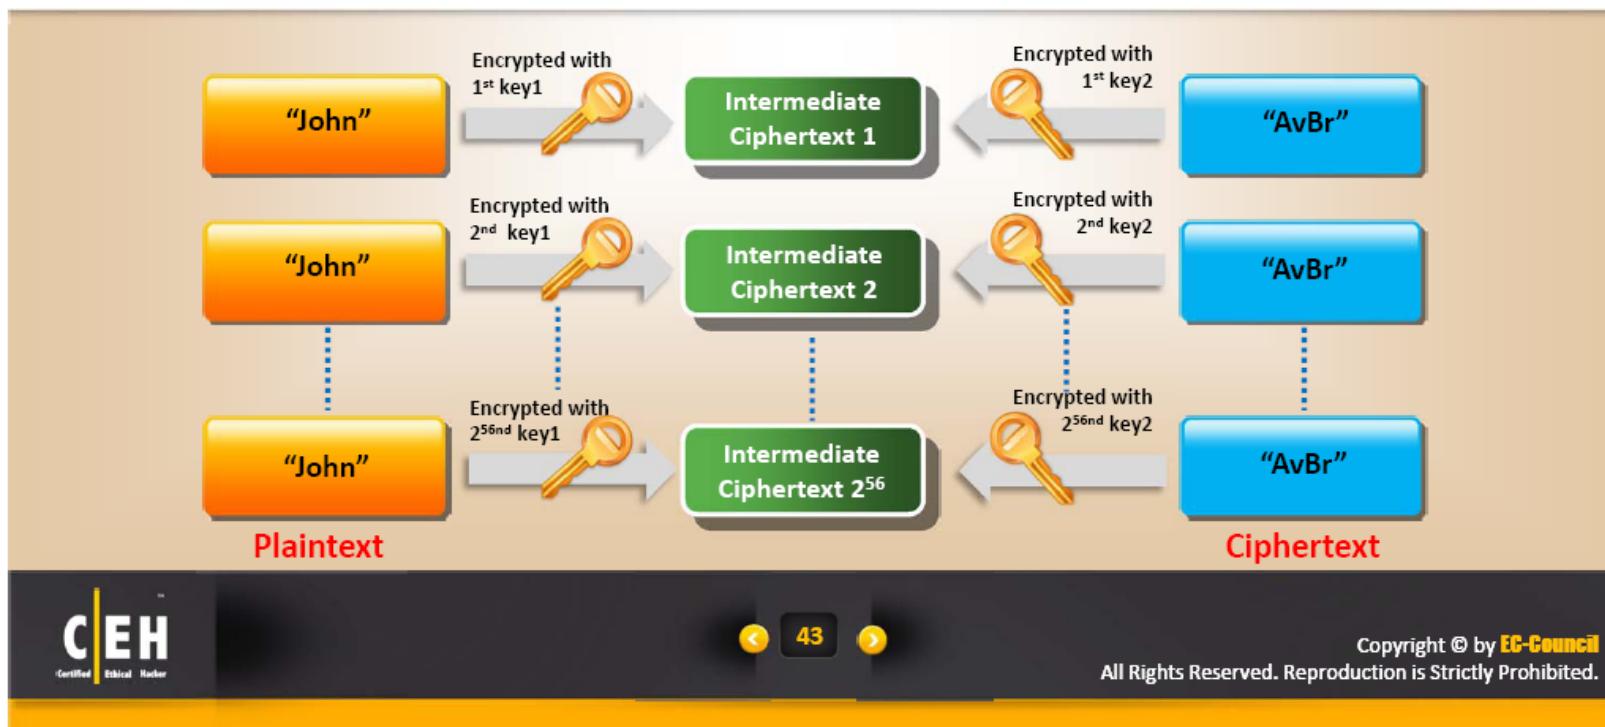

Power/Cost	40 bits (5 char)	56 bit (7 char)	64 bit (8 char)	128 bit (16 char)
\$ 2K (1 PC. Can be achieved by an individual)	1.4 min	73 days	50 years	$10^{20}$ years
\$ 100K (this can be achieved by a company)	2 sec	35 hours	1 year	$10^{19}$ years
\$ 1M (Achieved by a huge organization or a state)	0.2 sec	3.5 hours	37 days	$10^{18}$ years

Estimate Time for Successful Brute – Force Attack

All Rights Reserved. Reproduction is Strictly Prohibited.

# Meet-in-the-Middle Attack on Digital Signature Schemes

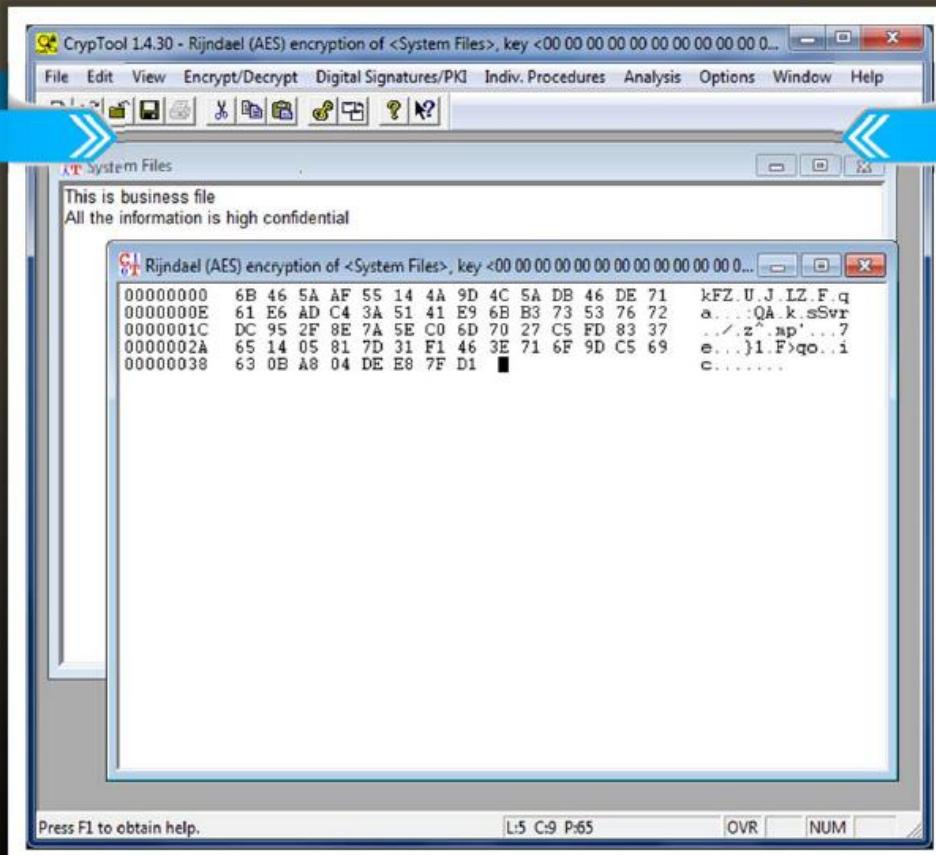

- The meet-in-the-middle attack **breaks a cipher** into two parts, works against each separately, and compares results
- It can be used for **forging signatures** on mixed-type digital signature schemes, and takes less time than an exhaustive attack
- The attack works by **encrypting from one end** and **decrypting from the other end**, thus meeting in the middle

# Module Summary

- ❑ Using Public Key Infrastructure (PKI), anyone can send a confidential message using public information, which can only be decrypted with a private-key in the sole possession of the intended recipient
- ❑ RSA encryption is widely used and is a de-facto encryption standard
- ❑ The MD5 algorithm is intended for digital signature applications, where a large file must be compressed securely before being encrypted
- ❑ SHA algorithm takes a message of arbitrary length as input and outputs a 160-bit message digest of the input
- ❑ Secure Sockets Layer, SSL is a protocol for transmitting private documents via the Internet
- ❑ RC5 is a fast block cipher designed by RSA Security

# Quotes

“ Programming can be fun, so can cryptography; however they should not be combined.”

- Kreitzberg and Shneiderman,  
Authors
